

Keywords/Questions:

File>Settings>Editor>Show Indent Guide

text-align:left;

width:25%

float:left;

clear:left;

float:right;

clear:right;

float:inherit;

float:none;

Notes:

Go to File>Settings>Editor. Then, tick the **Show Indent Guide** option.

-It creates lines which show you the opening and closing tag of elements.

-It especially useful for seeing the opening and closing tag of <div> elements.

text-align:left;

- aligns text or image to the left of the container.

- text alignment property in a child will override one in the parent.

width:25%;

- the width would be set relative to the parent element: div or body or

float property-used for wrapping text around a certain element e.g. let an image float left to the text in a container. By default the float property for all elements is float:none;

Programming

I design websites for fun. I have a solid understanding of Data Structures and Algorithms

Chess

Chess is my most favorite game. I have been playing chess intensively throughout highschool.

```
.hacking-img{
  width:25%;
  float:left;
  margin-right:30px;
}
.chess-img{
  width:25%;
  float:right;
  margin-left:30px;
}
```

float:left;- element floats to the left of its container.

float:right; :-element floats to the right of its container.

float:inherit:- element inherits the float value of its parent.

Summary:

Open Atom>File>Settings>Editor>Show Indent Guide option :-draws a line between the start&end of an element.

text-align:left; :- aligns the element to the left of the container.

width:- css property to set the width of a block or inline-block element. If specified in %, its relative to its container.

float:-used for wrapping elements around certain elements. We use terms like

-float:left;

-float:right;

-float:inherit;

-float:none;

clear: serves as an anti-float. It prevents the effect of float from being applied on elements. We can use terms like

-clear:left;

-clear:right;

More Notes

–How do we prevent the effect of float from being applied on some of the elements?

–We can use the **clear** property.

–clear: serves as an anti–float.

–we apply the clear property to a part of text we don't want it to be wrapped next to the element we floated.

Programming

I design websites for fun. I have a solid understanding of Data Structures and Algorithms. I do coding interview problems in my free time, and enjoy figuring out new ways to solve problems.

Chess

Chess is my most favorite game. I have been playing chess intensively throughout highschool.

```
.programming-img{
  width:25%;
  float:left;
  margin-right:30px;
}
.programming-text{
  clear:left;
}
.chess-img{
  width:25%;
  float:right;
  margin-left:30px;
}
.chess-text{
  clear:right;
}
```

–we prevented the programming and chess description texts from wrapping the images.

–Angela recommends to only use float when really, really necessary and only use it for what it's meant, which is wrapping text around a certain element and don't use it for positioning. Instead, use what we learned about positioning like relative or absolute positioning or using the margin and the padding for the layout and the positioning of your website, and to leave the float property only for the cases of wrapping text.
